

SWISS TYPE AUTOMATIC LATHE equipped with star motion control system

# **ST-20**

# Three turrets allows ultra high speed and flexible machining of complicated components!

The latest model in the ST series equipped with the highest level specifications and functions in the  $\varphi$ 20-class aimed at high productivity. Due to complex machining capability, this model is the best choice for suppliers of high-value added parts in the automobile, medical and aircraft industries.

## High productivity

- Simultaneous machining such as turning, milling, etc. by opposed twin turret tool post reduces the machining time drastically.
- Overlap machining of front and rear ends by back working turret tool post for shorter machining time.
- Several tools mounted on one side of the turret station for reducing the number of times of indexing and tool change time.
- •The Star motion control system for reducing the control path change over time, enhancing auxiliary functions and reducing the processing time.
- The number of tools mounted on the turret tool post allows multi-process machining without setup arrangement.
- The direct C-axis indexing function reduces the spindle indexing time.

### By the program optimization, the time required for the processes of [Retracting], [Next tool selection] and [Approach] can be minimized to reduce the non-cutting time.

### 

# Machining capability

- The back working turret enable complex machining equal to main spindle machining.
- The motors for the main and sub spindles have the same power so enhanced back working capability is equal to that of front working.
- The headstock stroke of 350mm (\*1), allowing machining of bar materials up to 350mm only by one chucking.
- Combination with the high-pressure coolant unit enables deep-hole drilling (maximum 100mm) on both the front and rear ends.

ST-20 with complex machining capabilities enhanced for both the front and rear ends equally. Machining of complicated components can be dramatically changed.

\* Opposing turrets on the front side

# Tool post on the front side

Complex machining such as turning, milling, skewed hole drilling and deep hole drilling can be done simultaneously by opposed two turrets, reducing the cutting time.

Simultaneous machining reduces cutting time

# Tool post on the rear side

Complex machining is possible equally and simultaneously with the front end machining. Even eccentric components can be picked up and machined on the rear ends.
